STUDY COACH AI

Week 4 Check-in: Objectives and HAI Principle Ladder

Project Plan v1 — Milestone 2

Team Members:

- Hussein Mohamed Abdel Fattah
- Khaled Sherif Mohamed
- Sondos Mohamed Hussein Afify
- Mohamed Tamer Mohamed

Project Status: Planning draft. The objectives, features, and tools described below are proposed plans unless explicitly identified as completed and tested.

1. Project Overview

Study Coach AI is an educational assistant designed to help university students understand course materials, practice questions, prepare for examinations, and review mistakes. The project aims to support students with different technical proficiency levels, AI experience, and accessibility needs.

The system is intended to allow users to ask questions about course content, receive understandable explanations, request hints or step-by-step guidance, and review the sources used to generate answers. Users should also be able to change the explanation style and provide feedback when an answer is incorrect or unclear.

The initial prototype will focus on Human-AI Interaction (HAI) course materials. The provided course chapters will serve as the intended knowledge source, subject to verification and applicable usage permissions.

1.1 Week 4 Objectives

The purpose of this milestone is to define how the team will design, evaluate, and demonstrate Study Coach AI.

The main objectives are:

1. Create a journey map for each of the three fictional personas defined in Week 3.
2. Establish measurable objectives for AI answer quality, user experience, learning support, and HAI principles.

3. Develop HAI Principle Ladder v1 with four levels: Inform, Explain, Allow Control, and Enable Feedback.
4. Select suitable tools for the model, backend, interface, and knowledge-grounding process.
5. Define a practical demonstration and evaluation plan.
6. Document the prompts used during Week 4 and distinguish completed activities from planned activities.

1.2 Current Status and Assumptions

This document describes Project Plan v1. It does not claim that all proposed features have already been implemented.

The Week 3 report describes a synthetic educational question-and-answer dataset containing a target of 30 records. However, the report also states that the draft answers have not yet been fully verified against the approved HAI course materials. The team must confirm the actual number of records and verify the answers before using the dataset as a trusted course knowledge source.

All three personas are fictional. No real student records, identifiable screenshots, or sensitive personal information will be used in AI-assisted development.

All numerical targets in this document are proposed acceptance criteria. Actual results must be measured and documented after testing.

2. User Journey Maps

A user journey map describes the steps a user follows when interacting with Study Coach AI. Each journey includes five stages:

1. Start
2. Ask
3. Understand the answer
4. Act or fix a problem
5. Finish

Each stage identifies the user's actions, potential pain points, and the HAI principles that can help address those problems.

2.1 Persona 1: Mariam Hassan

Technical level: Below typical
AI experience: Novice
Background: Fictional 19-year-old university student from rural Egypt who primarily uses a smartphone.

Mariam wants to understand difficult course concepts, prepare for examinations, and practice questions independently. She may struggle with academic terminology and prompt formulation. She may also assume that AI-generated answers are always correct.

Her interaction needs include simple language, readable text, short explanations, and clear instructions.

Mariam's Journey Map

Stage	User Action	Pain Point	Design Response and HAI Principle
1. Start	Mariam opens Study Coach AI and selects a course chapter.	She may not know where to begin or what to ask.	Provide a simple start screen, suggested topics, and example questions. Inform / Allow Control
2. Ask	She types a question or selects a suggested question.	She may not know how to formulate an effective prompt.	Accept natural-language questions and offer prompt starters. Allow Control
3. Understand	She reads the answer and checks its source.	Long explanations and academic terminology may be confusing.	Provide a simple explanation, define important terms, and display the course source. Explain / Inform
4. Act or Fix	She requests a hint, a simpler explanation, or step-by-step guidance.	Repeating the same explanation may not resolve her confusion.	Offer selectable help modes and an option to report an incorrect or unclear answer. Allow Control / Enable Feedback
5. Finish	She answers a practice question and reviews the explanation.	She may finish without knowing whether she understood the concept.	Provide an optional comprehension check and a short recap. Explain

Expected Outcome

Mariam should be able to ask questions without advanced prompting skills, understand the resulting explanations, identify the relevant course source, and request a different type of help when needed.

The design should reduce unnecessary complexity without assuming that Mariam is incapable of understanding difficult concepts.

2.2 Persona 2: Omar Khalid

Technical level: Typical
AI experience: Novice
Background: Fictional 21-year-old university student from Jordan.

Omar regularly uses digital learning platforms and productivity applications. However, he has limited experience evaluating the reliability of AI-generated educational answers.

His goals include reviewing course material efficiently, identifying mistakes, and preparing for examinations. He needs clear source references and a reliable way to report incorrect answers.

Omar's Journey Map

Stage	User Action	Pain Point	Design Response and HAI Principle
1. Start	Omar selects a course chapter and chooses a study goal.	Navigation may be unclear or time-consuming.	Provide consistent navigation and show the selected topic. Inform
2. Ask	He asks a specific course-related question.	Generic answers may not address the exact question.	Answer the intended question and request clarification when necessary. Allow Control
3. Understand	He reads the answer and checks the cited source.	The AI may introduce information that is not supported by the course material.	Retrieve relevant course passages and display identifiable chapter or section references. Inform / Explain

4. Act or Fix	He reports an incorrect answer or requests clarification.	He may not know how to challenge an AI answer or recover from an error.	Provide an accessible feedback option and a clear way to request a correction. Enable Feedback / Allow Control
5. Finish	He reviews key points and answers practice questions.	He may mistake a fluent explanation for a verified answer.	Keep source references visible and show practice results separately from claims about answer confidence. Inform / Explain

Expected Outcome

Omar should be able to review course material efficiently, verify where answers came from, recognize when an answer needs checking, and report incorrect or unhelpful responses.

The design should encourage informed trust rather than blind trust in the AI system.

2.3 Persona 3: Amina Ahmed

Technical level: Advanced
AI experience: Experienced
Background: Fictional 22-year-old university student from Nigeria who has low vision.

Amina is experienced with digital learning platforms and AI-assisted study tools. She wants to explore complex topics, compare explanations, and control the level of detail in study materials.

Her accessibility needs include adjustable text size, strong visual contrast, structured content, keyboard navigation, and screen-reader compatibility.

Amina's Journey Map

Stage	User Action	Pain Point	Design Response and HAI Principle
1. Start	Amina opens the system, adjusts the	Small text, poor contrast, or inaccessible controls	Provide adjustable text size, sufficient contrast, keyboard

	display if needed, and selects a topic.	may prevent effective use.	navigation, and clear labels. Allow Control
2. Ask	She submits a detailed prompt or asks for a comparison between concepts.	The system may oversimplify the topic or miss part of her question.	Support detailed explanations and clarify ambiguous questions. Allow Control / Explain
3. Understand	She reviews the structured answer and checks its source.	Unstructured text or missing citations can make verification difficult.	Use meaningful headings, organized explanations, and identifiable source references. Inform / Explain
4. Act or Fix	She requests a deeper explanation or reports a source mismatch.	Fixed explanation levels or inaccessible feedback controls limit her independence.	Keep explanation and feedback controls accessible using keyboard and assistive technology. Allow Control / Enable Feedback
5. Finish	She reads a recap and answers a challenging practice question.	Visual-only results or color-dependent indicators may be inaccessible.	Provide text-based results and an accessible recap without relying on color alone. Explain / Allow Control

Expected Outcome

Amina should be able to explore course concepts at an advanced level while independently accessing explanations, source references, practice results, and feedback controls.

The interface should support her preferred assistive technology instead of assuming that every user interacts visually.

2.4 Journey Map Summary

The three journeys reveal several shared design requirements:

- Users need clear information about the sources of AI-generated answers.

- Explanation depth should be adjustable to support different technical and learning needs.
- Users should be able to request clarification and report problems.
- Accessibility should be considered throughout the interaction, not added only at the end.
- The system should not present unsupported answers as verified course facts.

These findings guide the measurable objectives and the HAI Principle Ladder in the following sections.

3. Measurable Objectives

Study Coach AI needs measurable objectives so that the team can evaluate whether the proposed design works as intended.

The following targets are proposed for prototype testing. They are not measured results.

3.1 Objective O1 — AI Answer Quality

Target: At least 90% of evaluated answers should be factually correct according to the approved course material.

Measurement method:

1. Prepare a test set of at least 30 course-related questions.
2. Record the expected answer and supporting course section before testing.
3. Compare each generated answer with the approved course material.
4. Have two team members independently review the answers where possible.
5. Record incorrect answers, unsupported claims, and disagreements.

The correctness rate will be calculated as:

$$CorrectnessRate = \frac{NumberofCorrectAnswers}{TotalAnswersEvaluated} \times 100$$

Example: If 27 out of 30 evaluated answers are correct, the correctness rate is 90%.

This example illustrates the calculation only; it is not an actual project result.

3.2 Objective O2 — Answer Grounding and Source Reliability

Target: At least 90% of course-related answers should include a relevant source reference that supports the answer, when a supporting course passage is available.

Measurement method:

- Check whether the response contains a source reference.
- Verify that the reference points to the correct chapter or section.
- Check whether the cited passage actually supports the answer.
- Record missing, incorrect, or irrelevant references as failures.

This objective measures source reliability separately from general answer correctness because an answer may appear correct without being supported by the intended course material.

3.3 Objective O3 — User Experience

Target: At least 80% of test participants should complete a basic study task without assistance from the evaluator.

The task will require the participant to:

1. Open a study topic.
2. Ask a question.
3. Find the answer's source reference.
4. Request a different explanation style.

Measurement method:

$$TaskCompletionRate = \frac{ParticipantsCompletingtheTaskIndependently}{TotalParticipantsTested} \times 100$$

The team should record the number of participants, the tasks completed, difficulties encountered, and any assistance required.

3.4 Objective O4 — HAI Principle: Inform

Target: At least 90% of evaluated answers should display a readable and correct source reference when supporting course material is available.

Measurement method:

The team will inspect responses and count how many display a correct, identifiable source reference.

The source must support the answer; merely displaying a chapter name is not sufficient if the cited chapter does not contain relevant information.

This objective supports the HAI principle of informing users about the basis of an AI-generated answer.

3.5 Objective O5 — HAI Principle: Allow Control

Target: At least 80% of test participants should be able to independently switch between the available explanation modes.

The planned modes are:

- Hint
- Simple Explanation
- Step-by-Step Explanation
- Detailed Explanation

Measurement method:

The evaluator will ask participants to change the type of help they receive. Successful completion will be recorded for each participant.

The team must not report this objective as achieved until the explanation controls have been implemented and tested.

3.6 Objective O6 — Learning Support

Target: At least 75% of submitted practice answers should be correct after the user has reviewed an explanation, using a predefined set of practice questions.

Measurement method:

- Prepare practice questions and an answer key.
- Allow the user to review the explanation.
- Ask the user to answer the practice questions.
- Compare the answers with the predefined answer key.
- Calculate the percentage of correct responses.

This measure evaluates performance on the selected practice questions. It does not, by itself, prove long-term learning or demonstrate that the AI caused an improvement.

3.7 Objective O7 — Accessibility and Feedback

Target: At least 90% of the defined keyboard-navigation test tasks should be completed successfully, with separate manual checks for screen-reader compatibility.

The test tasks will include:

- Starting a session.
- Entering a question.
- Reading the answer and its source.
- Changing explanation modes.

- Submitting feedback.
- Finishing the session.

The team will document any inaccessible controls, unclear labels, text-sizing issues, contrast problems, and screen-reader barriers.

3.8 Summary of Objectives

Objective	Category	Proposed Target
O1	AI answer correctness	At least 90%
O2	AI grounding and citation reliability	At least 90%
O3	User experience and task completion	At least 80%
O4	HAI principle: Inform	At least 90%
O5	HAI principle: Allow Control	At least 80%
O6	Learning support	At least 75%
O7	Accessibility and feedback	At least 90% of keyboard tasks

The team will prioritize O1, O3, O4, and O5 if the initial evaluation must be limited to four metrics. The remaining objectives can be included as the prototype develops.

4. HAI Principle Ladder v1

The HAI Principle Ladder describes four levels of interaction that the proposed Study Coach AI system should support.

The levels are Inform, Explain, Allow Control, and Enable Feedback. Each level is linked to a measurable objective and a way to evaluate its implementation.

Level 1: Inform

Purpose: Make the basis of an AI-generated answer visible to the user.

Expected system behavior:

- Display the relevant course chapter or section.
- Make source references easy to locate.
- Indicate when the retrieved course material does not provide enough evidence for an answer.
- Avoid presenting an unsupported response as a verified course fact.

Problem addressed: Students may trust an AI answer without knowing where it came from.

Linked objectives: O2 and O4.

Success criteria: At least 90% of evaluated answers with available supporting passages display a correct, readable source reference.

Level 2: Explain

Purpose: Help users understand the answer rather than merely receive a result.

Expected system behavior:

- Provide a direct response to the question.
- Explain important concepts in understandable language.
- Use examples and step-by-step explanations when appropriate.
- Identify limitations when the supplied material does not support a confident answer.

Problem addressed: A technically correct answer may still be difficult to understand, especially for novice AI users.

Linked objectives: O1 and O6.

Success criteria: Answer reviews confirm correctness, and practice-question results are recorded against a predefined answer key.

Level 3: Allow Control

Purpose: Let users decide how they want the system to help them.

Expected system behavior:

- Offer Hint, Simple Explanation, Step-by-Step Explanation, and Detailed Explanation modes.
- Allow users to request clarification or a different explanation style.
- Provide accessible controls for users with different interaction needs.

Problem addressed: A single explanation style may not meet the needs of both novice and advanced users.

Linked objectives: O3, O5, and O7.

Success criteria: At least 80% of test participants can independently switch between the available explanation modes.

Level 4: Enable Feedback

Purpose: Allow users to challenge answers and report problems.

Expected system behavior:

- Provide a way to report incorrect answers.
- Allow users to identify answers that are unclear, irrelevant, or missing a source.
- Provide clear confirmation when feedback has actually been recorded.
- Make feedback accessible to users with different needs.

Problem addressed: Without feedback, incorrect or confusing responses may go unnoticed.

Linked objectives: O3 and O7.

Success criteria: Test participants can find and use the feedback control, and the team can inspect the feedback record if storage has been implemented.

Important limitation: Collecting feedback does not automatically mean that the AI model learns from every report. Any claim of automatic model improvement would require a separately implemented and tested process.

4.1 Principle Ladder Summary

Level	Principle	Main Capability	Linked Objectives
1	Inform	Show source references and limitations	O2, O4

2	Explain	Provide understandable, structured explanations	O1, O6
3	Allow Control	Let users choose explanation depth	O3, O5, O7
4	Enable Feedback	Allow users to report problems	O3, O7

The ladder provides a practical way to connect HAI principles to observable system behavior and measurable outcomes.

5. Tool Choices

The team needs to select tools that support the intended prototype without introducing unnecessary complexity.

The following choices are proposed and must be confirmed by the team before implementation.

5.1 Language Model

Proposed choice: A hosted Large Language Model (LLM) API for the initial prototype.

A hosted API can reduce the need for powerful local hardware and make it easier to integrate a language model into a student project.

An open-source model is an alternative if the team can support its hardware, deployment, and maintenance requirements.

Selection criteria:

- Answer quality on the approved course material.
- Integration with the backend.
- Cost and rate limits.
- Data-handling and retention terms.
- Availability and reliability.

The team should not send real student records or sensitive personal information to the model.

5.2 Backend

Proposed choice: Python with FastAPI.

The backend will coordinate the main system operations, including:

- Receiving user questions.
- Retrieving relevant course material.
- Preparing the model prompt.
- Calling the language model.
- Returning the answer and source metadata.
- Handling errors and feedback submissions.

The backend should validate inputs, handle model or network failures, and protect API keys using environment variables rather than hard-coding secrets into source code.

5.3 User Interface

Proposed choice: Streamlit for the initial prototype.

Streamlit can provide a quick way to demonstrate the educational workflow without requiring a large frontend implementation.

The interface is intended to include:

- Course or topic selection.
- A question input field.
- An answer display area.
- Source references.
- Explanation-mode controls.
- Practice questions.
- A feedback option.

Accessibility must be tested rather than assumed. The team should check text resizing, contrast, keyboard navigation, labels, and screen-reader compatibility.

5.4 Knowledge Source

Proposed choice: Approved HAI course materials, initially focusing on the provided Chapters 1 and 2, subject to the applicable course-use permissions.

The source material will define the scope of the initial course-grounded prototype.

Before use, the team should:

1. Confirm which files and sections are approved for use.
2. Extract or organize the relevant text.
3. Preserve chapter and section information.
4. Review the synthetic question-and-answer records against the approved material.
5. Record source references that can be checked by a reviewer.

The team must not assume that permission to use course materials in a class assignment automatically permits public redistribution.

5.5 Answer Grounding

Proposed approach: Retrieval-Augmented Generation (RAG), or a simpler retrieval-based implementation for the first prototype.

The intended process is:

1. Organize the approved course text into smaller passages.
2. Attach source metadata, such as chapter and section, to each passage.
3. Retrieve passages relevant to the user's question.
4. Provide the retrieved passages to the language model as context.
5. Instruct the model to answer using the supplied material and identify the relevant source.
6. Display the answer and source reference to the user.
7. If the supplied material does not support an answer, communicate that limitation rather than inventing a source.

RAG can improve source traceability, but it does not guarantee that an answer is correct. The team must evaluate whether the retrieved passages genuinely support the generated response.

5.6 Data Storage and Evaluation

Proposed choice: Local CSV or JSON files for the initial test set and evaluation records.

A local file-based approach is sufficient for early testing and makes it easy to inspect individual questions and responses.

A database can be considered later if the prototype requires persistent user sessions or feedback records.

The team should minimize stored data, use fictional test cases, and restrict access to evaluation records.

5.7 Tool Choice Summary

Component	Proposed Tool or Method	Main Purpose
Language model	Hosted LLM API	Generate educational explanations

Backend	Python + FastAPI	Coordinate retrieval and model calls
Interface	Streamlit	Provide the student-facing prototype
Knowledge source	Approved HAI course chapters	Supply course-specific information
Grounding	Retrieval-based approach / RAG	Connect answers to source passages
Test data	CSV or JSON	Store test questions and expected answers
Evaluation	Human review rubric and usability checklist	Measure performance against objectives

These choices are a proposed implementation plan, not a claim that the tools have already been integrated.

6. Intended System Workflow

The intended Study Coach AI workflow is:

1. The user opens the system and selects a course topic or enters a question.
2. The user may choose a preferred explanation mode, such as Hint, Simple, Step-by-Step, or Detailed.
3. The backend searches the approved course material for relevant passages.
4. The system prepares a prompt containing the question and retrieved passages.
5. The language model generates a response based on the supplied context.
6. The interface displays the answer and relevant source reference.
7. The user can request another explanation style, answer a practice question, or submit feedback.
8. The team evaluates responses against the course material and records errors for review.

If no relevant passage is found, the system should explain that the approved source did not provide enough evidence. It should not invent citations.

7. Prototype Demonstration Plan

The Week 4 check-in requires the team to open a file or run a demo rather than only describe the project.

The team should demonstrate what has actually been built. If a feature has not yet been implemented, it should be identified as planned.

7.1 Demonstration Scenario A — Mariam

The team will demonstrate the intended workflow for a novice AI user.

1. Select a course topic.
2. Ask a simple question.
3. Display an understandable explanation.
4. Locate the source reference.
5. Request a simpler explanation or a hint.

What this demonstrates: Inform, Explain, and Allow Control.

7.2 Demonstration Scenario B — Omar

The team will demonstrate how a user checks an answer and reports a problem.

1. Ask a course-specific question.
2. Inspect the answer and source reference.
3. Identify an answer that is incorrect or insufficiently supported, using a prepared test case if necessary.
4. Submit feedback if the feature exists.

What this demonstrates: Source grounding and Enable Feedback.

The team must not pretend that an answer is incorrect or that feedback was stored if the actual system does not behave that way.

7.3 Demonstration Scenario C — Amina

The team will demonstrate the intended accessible workflow for an advanced user with low vision.

1. Adjust text size or use available accessible controls.
2. Request a detailed explanation.
3. Navigate the structured answer and source reference.

4. Locate and use the feedback control if implemented.

What this demonstrates: Allow Control, Explain, and accessibility support.

7.4 Evidence to Show

During the check-in, the team should be prepared to show:

- The project plan.
- The actual dataset and its current verification status.
- A sample question and expected source.
- The generated answer and its evaluation.
- The relevant source reference.
- Any implemented explanation or feedback controls.
- The current limitations and next steps.

A design description is not a substitute for a working feature. Unimplemented features must be labelled honestly.

8. Evaluation Procedure

The team will use a repeatable evaluation process to measure the objectives defined in Section 3.

8.1 Prepare a Test Set

Prepare at least 30 test questions from the approved course material. For every question, record:

- The question.
- The expected answer.
- The relevant chapter or section.
- The expected source passage.
- The review criteria.

The expected answer and source should be documented before evaluating the generated response.

8.2 Evaluate Answer Quality

For each response, record:

- Whether the answer is factually correct.
- Whether it addresses the question.
- Whether its source reference is correct.
- Whether the cited passage supports the answer.

- Whether it includes unsupported claims.
- Whether the explanation is understandable.

Errors should be documented rather than removed from the evaluation set.

8.3 Evaluate User Experience

Use a consistent task script for participants. Observe whether they can start a session, ask a question, find the source, switch explanation modes, and submit feedback.

Record task completion, difficulties, requests for assistance, and ease-of-use ratings.

8.4 Evaluate Accessibility

Review the main user flows for:

- Text resizing.
- Contrast and readability.
- Keyboard navigation.
- Clear labels and headings.
- Screen-reader compatibility.
- Accessible feedback controls.
- Results that do not rely on color alone.

The team should document issues and re-test after making improvements.

8.5 Report Results Honestly

The final evaluation report should distinguish:

- Proposed targets.
- Features implemented.
- Tests completed.
- Measured results.
- Limitations and unresolved problems.

The team should not claim that an objective was achieved simply because a target was written in the project plan.

9. Risks, Limitations, and Mitigation

Risk	Why It Matters	Proposed Mitigation

Unsupported or hallucinated answers	Fluent answers may be wrong or outside the course scope.	Retrieve approved passages, show source references, and test answers against an answer key.
Unverified synthetic data	Draft answers and source notes may contain errors.	Verify each record against the approved course material and document its review status.
Over-trust in AI	Students may accept an answer without checking it.	Make sources and limitations visible and avoid guarantees of correctness.
One explanation style	Novice and advanced users may need different levels of detail.	Provide selectable explanation modes and evaluate their usability.
Accessibility barriers	Low-vision users may be excluded by the interface.	Test text size, contrast, structure, keyboard access, and screen-reader compatibility.
Cultural or language bias	Examples may unintentionally exclude some students.	Review examples for inclusive representation and avoid assumptions about ability based on nationality.
Privacy risks	Real student information may be exposed unnecessarily.	Use fictional examples, minimize logs, and review provider data-handling terms.
Misleading feedback claims	A feedback button does not mean the model learns automatically.	Describe feedback as information for team review unless an automatic learning process is actually implemented.

Incorrect source citations	A citation may be visible but fail to support the answer.	Check source relevance and correctness separately from answer accuracy.

10. Appendix A — Prompt Log for Week 4

This appendix documents the prompts used or planned during preparation of the Week 4 project plan.

The assignment requires the exact prompt, tool name, generated output, and the team's changes and reasons. Planned prompts must not be reported as completed interactions until they have actually been submitted and reviewed.

Entry 1 — Drafting the Week 4 Project Plan

Tool Used: ChatGPT

Exact Prompt Used:

"Using the content and requirements of our Week 3 project document, develop a comprehensive Week 4 check-in report for our Study Coach AI project. Include three user journey maps based on the existing personas, measurable project objectives, an HAI Principle Ladder with four levels linked to the objectives, proposed technical tools and system architecture, a course-grounding workflow, a prototype demonstration plan, an evaluation procedure, potential risks and mitigation strategies, and a final check-in checklist. Maintain consistency with the previous project document, clearly distinguish proposed plans and target metrics from implemented features and measured results, and identify any information that needs verification before submission."

Output Generated:

A structured draft of the Week 4 Project Plan v1, including user journey maps, measurable objectives, the HAI Principle Ladder, proposed tool choices, answer-grounding steps, a demonstration plan, an evaluation procedure, and a prompt log.

Team Review and Changes:

The team should verify that all journey maps match the Week 3 personas, confirm the actual dataset record count, review draft answers against the approved course materials, and select tools that can realistically be implemented. Proposed features and target values must not be described as completed or achieved.

Reason for Using the Prompt:

To organize the Week 4 requirements into a detailed project plan that can guide implementation and evaluation.

Status: Draft generated in this interaction; team review is still required.

Planned Entry 2 — Reviewing the Measurable Objectives

Status: Planned. This entry must not be reported as a completed interaction until the prompt has actually been used.

Tool: ChatGPT

Planned Prompt:

> Review the proposed Study Coach AI Week 4 measurable objectives. For each objective, check whether the target, numerator, denominator, sample, and measurement procedure are clearly defined. Identify targets that cannot be evaluated with the current prototype and suggest feasible alternatives. Do not invent test results or claim that unimplemented features have passed evaluation.

Purpose:

To ensure that the proposed metrics can be measured consistently and that their targets are realistic for the project.

Documentation Requirement:

After using the prompt, record the actual output, the team's review, and the changes accepted or rejected.

Planned Entry 3 — Reviewing Answer Grounding

Status: Planned. This entry must not be reported as completed until the prompt has actually been used.

Tool: ChatGPT

Planned Prompt:

> Review the proposed Study Coach AI answer-grounding workflow using the approved HAI course materials. Identify possible failures, including no relevant retrieved passage, an incorrect citation, conflicting passages, and an answer that goes beyond the supplied source. Recommend test cases and safe fallback wording. Do not assume that retrieval guarantees answer correctness.

Purpose:

To identify weaknesses in the proposed grounding approach and improve the reliability of source references.

Documentation Requirement:

Record the actual output and the team's decisions after the prompt has been used.

Planned Entry 4 — Reviewing Accessibility

Status: Planned. This entry must not be reported as completed until the prompt has actually been used.

Tool: ChatGPT

Planned Prompt:

> Review the Study Coach AI journey for the fictional low-vision persona Amina Ahmed. Check the Start, Ask, Understand, Act or Fix, and Finish stages. Identify possible barriers involving keyboard navigation, screen readers, text size, contrast, structured answers, and feedback controls. Separate recommendations from features that have actually been implemented.

Purpose:

To identify accessibility barriers and prepare a practical accessibility testing checklist.

Documentation Requirement:

After using the prompt, record the actual output, which recommendations the team accepts, and any changes implemented.

Prompt Log Note

Only prompts that were genuinely submitted should be classified as completed entries. Planned prompts should remain labelled as planned until used.

Output summaries must reflect the actual interaction. The team remains responsible for checking the accuracy of generated material, verifying source permissions, and documenting whether proposed revisions were implemented.
